Transcriber's Office

April 5, 2000

LB 637, 972

deposited in a bank, and use those funds quicker. And then when you make the phone call, the call does not go to Des Moines, it goes to New York City. And then New York City will look at, you know, where is that money? Did we get that money? That is an analogous situation. What we're doing is with this SDU, that we've already designated the Treasurer as, is going to receipt...receive and disburse the money. The money is going to be received from businesses, and then it's going to be sent out from the Treasurer to the appropriate custodial parent. I don't see why the call center has to be physically located in the same room, building, whatever, as the central or as the distribution unit. I don't understand that. Nobody has demonstrated why. This type of scenario happens every day in business. Again, you know your money is sent to a centralized location, and yet the entity to which the money ultimately goes is not even close to that. It's a perfect analogy. I wanted to touch a little bit on, again, the bill that we passed last year in the form of LB 637 designated basically the Treasurer, which we did this year, as the person in charge of the State Disbursement Unit. The amendment that we're working on today talks about the Title IV-D Division establishing a Customer Service Unit. Health and Human Services wants to say that these are two of the same things. They are not. They are not mixed up together. The statute has set out that there is a customer, or excuse me, a State Distribution Unit and a Customer Service Unit. They are two separate pieces, and I assume that even if they were in the same building, they would be wired together through computer terminals or what have you. I doubt very much that when somebody calls an operator, that that operator is going to run up to the next floor, to the next room, and rifle through the checks to find out if Mr. Smith has sent his support check. That's not how it works. How it works is the check comes in, it's automatically fed into a computer. That person's account reflects either a credit that either the check was there or a debit that it's not there, and they go from there. I mean I don't...I don't...do those two entities need to communicate? Absolutely. Do they need to be on the same floor, the same room, the same building? I don't see why. I think if you think about it, you can find similar situations now where we have a call center that is separate and distinct from the actual business or the person, in this situation, to which the money would flow. If Senator Kristensen wants to talk about
